## SUMMARY

Full-stack developer transitioning from four years of active duty military service. Enjoys front-end design with custom CSS, SASS, and Photoshop, while incorporating JavaScript and PHP to build interactive UI/UX features. Seeks to use the most efficient code and strives to be an extremely cooperative team member.

## SKILLS

- **Front-End:** JavaScript, jQuery, SASS, Flexbox, Bootstrap, Foundation, Scroll Magic, HTML, CSS
- **Design:** Adobe Photoshop, Adobe Illustrator, Adobe Premiere
- **Back-End:** PHP, Java, Python, MySQL, Django, Laravel, Linux, Apache
- **Version Control:** Git, Github
- **Military:** Project management, secret clearance, high stress management, team player, personnel leadership

## SOFTWARE DEVELOPMENT PROJECTS

### Olympus - PC Builder

Olympus is a full-stack web application with a heavy focus on backend and database management. This web application allows a user to create a custom built PC, based off dynamically displayed data that populates on user input ; ensuring compatibility between parts. The backend utilizes PHP and Laravel to do the bulk of the logic and data handling. The frontend takes advantage of a custom Bootstrap 4 source, SASS and React JS in order to create a fluid and unique user experience.

### Ad Lister - Pie Piper

A full-stack web application that is designed to allow users to buy and sell items locally, much like Craigslist. The data is stored using MySQL and handled by a model, view and controller that is entirely built on vanilla PHP. This allows users to sign-up/login to an account and manage their ads. The front-end utilizes Bootstrap 4 and SASS to allow for a quick and organized startup of the application.

### LCARS - Simple Simon

Simple Simon in itself is a memory game where a color pattern is shown and the player must mimic the pattern. Each time the player gets a pattern right, the pattern is repeated and increased by one; until the player fails to get the sequence correct. The application was themed around Star Trek's LCARS to display front-end development. Adobe Photoshop, Illustrator and HTML/CSS were used to create a near exact replica of a LCARS panel design. Whereas JavaScript and jQuery were used to create the animations, sounds and logic.

## WORK EXPERIENCE

### Schriever Air Force Base, Colorado Springs, CO 2012-2016

#### Satellite Operator and Ground Engineer

- Troubleshoot Windows and Linux operating systems, hardware, and networking applications.
- Oversaw the transition to automated operations; trained operators on new automation checklists and operations.
- Provided customer support in core Windows and Microsoft office applications: Excel, Powerpoint and Word.
- Maintained and tested four Windows/Linux server rooms and their components (firewalls, servers, timing, routers, encryption/decryption devices, etc) monthly to ensure 100% uptime.
- Improved checklists and system documentation in order to perform tasks more efficiently.
- Maintained two satellite constellations totalling \$5.4B; acquired expertise on thermal, propulsion and electrical subsystems.
- Recovered two DSCS III satellites, preventing loss of spacecraft; resulted in \$400M saved.

## EDUCATION

- **Codeup, San Antonio, TX** February - May 2017
- **Community College of the Air Force, Montgomery, AL** 2012 - 2016
